

Burn Classification of Bridger Range Fire

The results provided here show that the majority of damage caused by the fire is centered around the southeast side of the Bridger Range. The region to the east looks to be just cloud cover.

Of the focus parcel region, the majority of the vegetation affected was burnt trees, and small minority being burnt grass. Other than that, it looks to be that there was nearly no grass regions left unaffected, and only a very small portion of trees were left unburnt.

The affected region had a minimum elevation of 1693 meters, and reached up to 2371 meters. The majority of the affected region was between 1820 and 1990 meters.
